The major objective of the European Sea Level Service (ESEAS) is the enhancement of the exploitation of sea level and related databases both in scientific and non-scientific applications. In order to achieve this, the ESEAS identifies and promote user requirements as well as requests and wishes made by the users for the specific products. The implementation of the ESEAS is based on international collaboration of governmental and non-governmental organizations operating tide gauges along the European coasts or providing sea level related information originating from other sources such as satellite altimetry and GPS at tide gauges. The ESEAS aims to provide quality-assured sea level and sea level related information for European waters to a broad range of scientific and non-scientific user.
