

Once bitten twice shy – Experience gained from Work in an experimental Basin in the Alps

P. Haas, R. Kirnbauer

Institute for Hydraulic and Water Resources Engineering, Vienna University of Technology, Vienna, Austria. haas@hydro.tuwien.ac.at

When the authors of this poster began their work in the experimental catchment Löhnersbach (province of Salzburg, Austria; gauge at 12° 40.02' E, 47° 21.50' N; WGS84) in the northern Greywack zone of the Alps nearly fifteen years ago they certainly had formed a clear picture of the investigations to be performed but they were not too well versed in handling measuring instruments and installing them in a rather harsh Alpine environment. Since then, many lessons had to be learned. In retrospect, many of them, today, seem to be the most natural thing of the world, but some of the problems arising from the imponderability of the environment are still not solved. The poster presents some problems, some solutions and some other problems where we still put a question mark (and a smile) behind.
