Groundbased interferometric radar measurements for monitoring of unstable slopes

1 Richard Norland

ISPAS as, P.O.Box 219, NO-1501 Moss, Norway (Richard.Norland@ispas.no / + 47 92252612)

Interferometric radars are becoming an operation tool for surveillance and monitoring of small movements from a distance both due to the reduced cost of acquiring and operating them both also because the technology and operational experiences have matured.

The paper presents different groundbased interferometric radar systems and their applications for natural hazards monitoring.
