Over the past decade space environment international standards have been developed within the scope of ISO WG4 activities. In 1993, Working Group 4 (WG4) was organized in the scope of SC14 (Subcommittee 14 was specially organized in order to develop and publish the standards dealing with space systems) for developing the ISO standards of the surrounding space environment. This has been the first attempt to develop international standards of physical phenomena of natural environment such as galactic cosmic rays (GCR), solar energetic particles (SEP), the Earth's magnetic field, the ionosphere, the plasmasphere, solar irradiance, etc. In this report of the WG4 Chair the preliminary version of the roadmap activity will be presented.
