

Forcing of the European Sea Level

Tsimplis M.N. and A.G.P.Shaw

James Rennell Division for Ocean Circulation and Climate, Southampton Oceanography Centre, U.K., (contact mnt@soc.soton.ac.uk)

We explore the forcing contributions to sea level variability around Europe. The steric and meteorological contributions are quantified for the various basins. The influence of the NAO on the various forcing parameters are explored. The role of the NAO is found to be important all around Europe. Nevertheless its significance is expressed through different forcing mechanisms in each of the regions.
