

Skewness and kurtosis in the diabatic atmospheric boundary layer

A. Maurizi and F. Tampieri

ISAC CNR, via Gobetti 101, 40129 Bologna, Italy (f.tampieri@isac.cnr.it)

Recent works on parameterisation of atmospheric boundary layer address the need to a proper description of high order moments of velocity and temperature. Measurements and models thus concentrate on skewness and kurtosis. Based on different measurements we review the relationship between skewness and kurtosis, and discuss their dependence on the stability conditions of the boundary layer.
