

Was the July 2002 earthquake in Western Europe Predicted?

L. Rebbouh and **M. Ausloos**

Univ. Liege, Liege, Belgium

We have used the relationship between time intervals and distance from epicenters for the appropriate range of Guttenberg scale magnitudes in order to study the location and time occurrence of earthquakes in the Liege, Belgium region. It can be concluded that the July 22, 2002 earthquake in Eschweiler of magnitude 5.1 could have been predicted as far as several months in advance.
