The CEGRN GPS campaigns cover a substantial part of Central Europe between the Baltic and the Mediterranean Sea. Observations are made 1994, 1995, 1996, 1997, 1999, 2001, 2003, 2005 and 2006. A reprocessing was done using the new guidelines and models from IGS/EPN which include absolute calibrations of antenna phase centre variations, new models of the troposphere and a minimum elevation of five degrees. Six 'old' IGS and EPN stations are added to the former data. The preliminary results in ITRF2005 are shown and compared to the old adjustments.
