

Definition of the cloud spatial distribution for modelling of UV irradiance under broken clouds conditions

Thierry Besnard(1) and Laurent Berger(2)

(1) ATMOS sarl, Rue Lucien Chaserant, Saint Saturnin, France, (2) IUT, Avenue Olivier Messiaen, Le Mans, France.

UV radiations have been monitored since several decades by a significant numbers of research staffs and modelling has been performed for clear sky and overcast conditions. For broken clouds conditions this aspect is still under development due to a lack of knowledge of cloud spatial distribution. In this communication, we will present results of modelling showing sampling conditions to match for an accurate description of the cloud
