## **MicrOmega/ExoMars: a microscopic search for potential biorelics**

**J-P. Bibring**, and the MicrOmega team

IAS, Orsay, France (bibring@ias.u-psud.fr)

The MicrOmega/ExoMars instrument is designed to characterize, at a grain scale, structures and phases of potential astrobiological relevance. We will present its major features, and discuss their performances in the context of presently acquired orbital data which enlighten the concept of Mars habitability in an unprecedented fashion.
