## **Systematic Errors, which occur while downscaling ERA40 data over Iceland using MM5 (grid size of 9km), have been analysed**

**M. Brötzmann**

University of Iceland (Maik.Broetzmann@gmx.de)

The greatest errors can be attributed to subgrid orography, but there are still substantial errors that must be explained otherwise. Important reasons for such errors are a shift in time or space of weather systems and erroneous representation of inversions and mixing in the atmospheric boundary-layer.
