On behalf of the German Federal Environmental Agency (UBA) statistical regional climate scenarios based at ECHAM5/MPI-OM SRES A1B, A2 and B1 results were calculated. Those results are accessible for everyone. They include on daily basis meteorological parameters of approx. 280 climate and 1700 rainfall stations, covering the time 1961 to 2100 and the whole German territory.

The presentation gives a look inside the dataset and shows aspects and limitations for the use in impact studies, eg. water supply, agriculture, biodiversity, tourism and human comfort.
